THE

NATURAL HISTORY

OF OAKLAND COUNTY: CONNECTIONS TO OUR PARKS

Oakland County was once under a mile of ice

For almost 2 million years, Oakland County was intermittently covered by as much as a mile of ice during a time known as the Pleistocene era.

At times, the weight and pressure of accumulating ice and snow caused glaciers to advance south across the landscape. When temperatures would increase, the glaciers would retreat back north.

Grateful for Glaciers

When glaciers advanced and retreated, the ice scraped up soil and rock, scouring the land like a giant sheet of sandpaper. Then as the ice melted, it left scraped up soil and rock in piles, shaping the landscape we see today.

Mammoths in **Oakland County**

During the Pleistocene era, many enormous animals lived in Oakland County. Some of these animals included the woolly mammoth, mastodon and giant beaver.

Woolly mammoth Mammuthus primigenius

OAKLAND COUNTY'S

NATURAL HISTORY

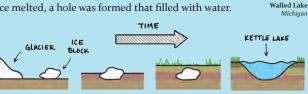

IN OUR BACKYARD

Remnants from the Ice Age

There are many things we pass by in our day-to-day lives that are pieces of evidence that glaciers were here. Listed below are some markers that could be found in your own backyard.

Kettle Lakes

Many of Oakland County's lakes are kettle lakes. Kettle lakes were created when large blocks of ice fell off a glacier and were completely buried by glacial debris. As the buried ice melted, a hole was formed that filled with water.

Glacial Erratics

Glacial erratics are large pieces of bedrock that have been transported by glaciers and deposited in a new location. Oakland County Parks has many trailside glacial erratics, such as this one located along the Independence Oaks Rockridge Trail.

Michigan Puddingstones

Puddingstones were not originally found in Michigan and were brought here by glaciers from Canada.

Prehistoric Plants

Some tree and shrub species in Oakland County such as honey locust, hawthorn and American plum, developed sharp spines to protect themselves from Pleistocene mega-fauna. These tree and shrub species can be found at Rose Oaks, Highland Oaks, and Red Oaks county parks.
